Compliance without Identities

unpruuf Compliance: secure, anonymous reporting without identities, on your own servers.

No identities collected. Company data stays on company servers.

Status: not audited, not certified.

The Human Barrier: Why do employees choose silence?

The Old Paradigm

Emails, web forms and messaging apps are built for identities. They require accounts, phone numbers or IP addresses.

The Digital Footprint

Every message carries metadata. Every server keeps logs. However secure the platform seems, the sender and the message stay linked.

The Consequence

Fear of retaliation and of data leaks on external servers (Cloud) is the main reason why irregularities are not reported in time.

The Legal Mandate: EU Directive (2019/1937)

Organizations with more than 50 employees and public institutions are required to implement secure internal reporting channels.

50+

Employees

Obligation to establish an internal reporting channel.

7 Days

Confirmation

Maximum deadline for confirming receipt of the report to the whistleblower.

3 Months

Feedback

Maximum deadline for giving feedback on the measures taken.

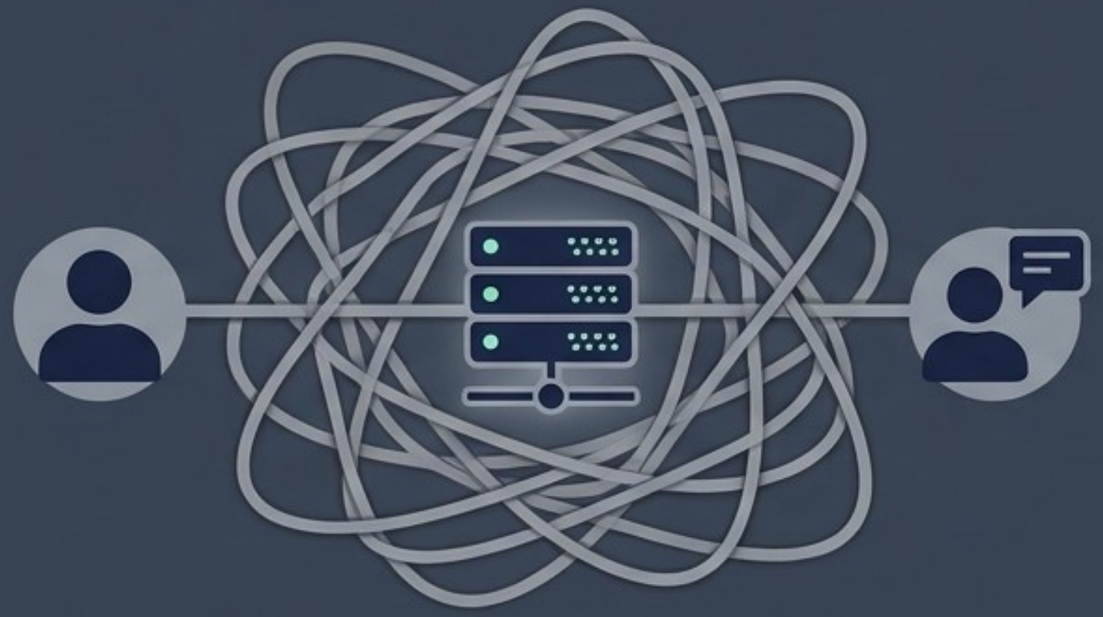

Limited

Retention

Records are kept no longer than necessary and proportionate. The exact period follows national law.

The Design Shift: Decoupling

The Typical Approach

Direct connection. Information passes through a central server that can see who is talking to whom.

The unpruuf Approach

No direct connection. No user identities by design: no profiles, no e-mail, no member lists. Sender and message are decoupled.

No Identities through ‘Digital Safes’

Instead of sending a direct message, the user places a “sealed envelope” in a digital safe located on your company’s server.

Tor Routing

Traffic runs through Tor, which hides the origin of a message from the server.

Packet Uniformity

All data packets have exactly the same fixed size, so the length of a message is not visible on the wire.

No Public IP Addresses

The server is reachable only as a Tor hidden service, with no public IP address exposed.

The goal: minimal metadata, so there is little to hand over.

Two-Way Anonymous Dialog

The law requires you to give **feedback within 3 months**. How do you answer someone you do not know?

The Whistleblower

- Stays anonymous (“guest” status, no account).
- Receives replies inside the app, without providing contact details.

The Compliance Officer

- Can ask clarifying questions.
- Can send the 7-day confirmation and the 3-month decision.

Result: Deadlines can be met while the reporter stays anonymous.

Data Sovereignty: Zero Custody

Traditional SaaS / Cloud

- Your data sits on someone else’s server.
- The external provider may have access to logs and messages.
- A central point that can be attacked or ordered to hand over data.

unpruuf Zero Custody

- **Own Infrastructure:** Data arrives directly on hardware you control (or a VPS).
- **NexonAI sees nothing:** NexonAI runs no servers, monitors no traffic and holds no copies of your data.
- **Local Storage:** The Compliance Officer’s app runs on the officer’s laptop, saving the case files locally and encrypted.

Easy for Employees

App plus server node. No IT effort for the employee.

1

Scan

The employee scans the QR code from a poster or from the intranet.

2

Connect

The free client app opens (no account creation, no phone number).

3

Secure Dialog

The employee starts reporting immediately, using the unique encrypted channel with the Compliance Officer.

Custom Rules per Channel

The same secured architecture. Different rules depending on procedure and legal requirements (Privacy by Design).

Documented Profile

(Whistleblowing)

Rule: Encrypted retention for the duration of the legal periods.

Action: Deletion after the retention period set by law and policy.

Function: Time limits set for the response.

Ephemeral Profile

(Journalism – pilot)

Rule: Data stays only in RAM.

Action: Immediate automatic deletion (e.g. within 24 hours).

Function: Designed so that little remains to be extracted.

Immutable Profile

(Official Complaints)

Rule: Protocol that cannot be deleted covertly.

Action: Personal content can be deleted, but the trace of the action remains.

Reporting Channels by Design Property

	E-mail & Forms	**General Messengers**	**Hosted Web** Platforms (SaaS)	**unpruuf Compliance**
Identity needed to report	Yes	Often (phone/ID)	Varies	✓ **No** (no identities)
Where the data lives	At the provider	At the provider	Provider cloud	✓ **Your own servers**
Anonymous two-way dialog	No	Limited	Varies	✓ **Yes**
Deadline tracking (7 days / 3 months)	Manual	Manual	Often built in	✓ **In the** dashboard
Metadata and logs	Kept by mail server	Depends on provider	Kept by provider	✓ **Minimal by design** (Tor routing)

General categories, not named products. unpruuf is not audited and not certified.

Not just an app. A design principle.

When we remove identity from the technical architecture, we reduce fear in the human equation.

For the Employee:

Room to speak up without leaving a trail of identities.

For the Compliance Officer:

Tools to keep the legal deadlines (7 days / 3 months).

For the Company:

Data stays on your own servers. No external custody.

Status: not audited, not certified.
